

NANOVEA ST500

***MODULAR LARGE AREA
OPTICAL PROFILER***

EXTREME PROFILOMETRY

*Designed with Chromatic Light technology, which measures physical wavelengths, the **NANOVEA ST500** Profilometer provides the highest accuracy on any roughness, form, or material.
Transparent or opaque.*

SPACIOUS & OPEN
DESKTOP PLATFORM

ULTRAFAST LARGE AREA
MEASUREMENTS

400 mm CONTINUOUS SCAN
STITCHING FREE

FULLY PROGRAMMABLE
ADVANCE AUTOMATION

With rotational options (stage or cylinder)
and 4 axis customization available,
ST500 expands your testing capabilities
beyond a standard profilometer.

X-Y
STAGE TRAVEL

400 x 400 mm Motorized

STANDARD SENSOR

SINGLE POINT

	PS1	PS2	PS3	PS4	PS5	PS6
MAX HEIGHT RANGE	110 μm	300 μm	1.1 mm	3.5 mm	10 mm	24 mm
WORKING DISTANCE	3.3 mm	10.8 mm	12.2 mm	16.5 mm	26.6 mm	20 mm
LATERAL X-Y ACCURACY	0.8 μm	1.7 μm	2.6 μm	4.6 μm	11.0 μm	11.0 μm
HEIGHT REPEATABILITY*	1.9 nm	5.4 nm	15.8 nm	31.6 nm	117.0 nm	237.2 nm

HIGH-SPEED SENSOR

192 POINTS

	LS1	LS2	LS3
MAX HEIGHT RANGE	200 μm	0.95 mm	3.9 mm
WORKING DISTANCE	5.3 mm	18.5 mm	41 mm
HEIGHT REPEATABILITY R_a*	14 nm	21 nm	70 nm
LINE WIDTH	0.96 mm	1.91 mm	4.78 mm
PITCH	5 μm	10 μm	25 μm
LATERAL ACCURACY OF EACH POINT	1 μm	2 μm	5 μm
ACQUISITION RATE (points per second)	384 KHz	384 KHz	384 KHz

* Fixed point measurement on glass. R_a average height variation for 1,200 points (100 samplings).

HOW IT WORKS

Chromatic Light Technology works by using white light and a set of sphero-chromatic lenses to split the light into individual wavelengths, each with its unique vertical focal point or height. All wavelengths, with their corresponding heights, make up the height range measurement scale of a sensor.

The spectrometer detects the wavelength with the highest intensity and processes its associated height measurement. During a full raster scan, this process takes only a fraction of a second and produces an accurate height map of the surface of interest.

NO COMPLEX ALGORITHMS ♦ **NO LEVELING REQUIRED** ♦ **NO X-Y DATA STITCHING**

THE PROBLEM WITH OTHER TECHNIQUES

LATERAL RESOLUTION vs LATERAL ACCURACY

THEM

To impress clients, companies often choose to define **Display Resolution** or **Camera Pixel Size** as lateral resolution. However, instruments that rely on camera pixel-based technology require complex algorithms to determine the focal point, which is problematic for analyzing complex surfaces.

US

Chromatic Light provides lateral **accuracy** which is determined by the physics and is directly related to the spot size of the chromatic light source of the optical sensor.

LASER SCANNING CONFOCAL MICROSCOPE

LASER RADIATION

HEALTH HAZARD

Exposure to laser light reflectivity

INCONSISTENT LASER LIGHT WAVELENGTH

Inconsistencies in wavelength during scanning
affect accuracy of results

DECEPTIVE 'DISPLAY RESOLUTION'

Lateral & height accuracy are fixed by the objective lens
making 'Display Resolution' insignificant

COMPLEX ALGORITHMS

Alpha blending algorithms stitch collected data
layer by layer, grounding accuracy on complex calculations

STITCHING REQUIRED

Objective lenses have limited fixed fields of view
Stitching of larger areas compromises accuracy of the scan

50x SLOWER

Data acquisition speed up to 7.9 KHz

VS

CHROMATIC LIGHT OPTICAL SENSOR

SAFE WHITE LIGHT

No need for protective wear

UNIFORM & BROAD WHITE LIGHT SPECTRUM

Changes in wavelength are the data being collected

INDEPENDENT LATERAL & HEIGHT ACCURACY

Lateral & height accuracy can be mixed and matched
to meet a broad range of scanning requirements

NO ALGORITHMS

Physical wavelength reflected from the surface
is measured directly for an accurate representative height map

NO STITCHING

Data points are collected continuously providing
the same level of accuracy for both small and large areas

50x FASTER

Data acquisition speed up to 384 KHz

LASER MICROSCOPE

OPTICAL SENSOR

LATERAL ACCURACY

For 50x objective (370 x 277 μm)

$\pm 2\%$ of measuring value

$\pm 2\% \times 370 \mu\text{m}$

$\approx 15 \mu\text{m}$

w/ stitching algorithms $\gg 15 \mu\text{m}$

Step size:

$= 5 \mu\text{m}$

3x BETTER LATERAL ACCURACY

HEIGHT ACCURACY

$\approx 0.2 + L/100 \mu\text{m}$

$\approx 0.2 + 950/100 \mu\text{m}$

$\approx 9.7 \mu\text{m}$

950 μm range

$\approx 0.6 \mu\text{m}$

16x BETTER HEIGHT ACCURACY

AREA TESTED

STITCHING REQUIRED

scans (25 x 25 mm)

$25\,000 \mu\text{m} / 370 \mu\text{m} \times 25\,000 \mu\text{m} / 277 \mu\text{m}$

68 x 91

$= 6188$ scans

NO STITCHING

Consistent accuracy across any measurement size

1 SCAN

TEST TIME

6 sec per scan

+ 4 sec displacement & stitching

$= 10 \text{ sec}/\text{scan} \times 6188 \text{ scans}$

$= 61860 \text{ seconds}$ ($\approx 17 \text{ hours}$)

Scan time (25 x 25 mm)

$= 29.6 \text{ seconds}$

2090x FASTER

MICROSCOPE VIDEO IMAGING

up to 50x
objective magnification

1200 x 1600
